

IN3050/IN4050 Group sessions week 01

The goal for this week is that

1. You get a working environment with the tools we will use in the course.
2. You get familiar with the tools we will use in the course.

To get a working environment on your own machine, the easiest way is to use Anaconda and follow the recipe in **anaconda-setup**.

If you prefer, you may alternatively build the environment yourself. You find a list of the packages we will use in **in3050_2022_env.yml**.

To get familiar with the tools, you have to find out how to run a jupyter notebook. You can then open the **test-notebook.ipynb** and work your way through it.
